Our editors self-research, test, and recommend the best products. You can find out more about our review process here. We may receive commissions for purchases made on selected links. Frequently asked questions How do air conditioners work? All types of air conditioners work pretty much the same way. First, they extract air and filter out any dust or impurities. This air is then transmitted through a cooling or evaporating coil, and the coil absorbs heat. At the same time, during this step, moisture from the air is reduced to dew on the surface of the coil, effectively reducing the level of humidity in the room. Finally, the air is moved away from the device, lowering the overall temperature of the room. What types of air conditioners are there? There are several different types of air conditioners. Window units are usually the most popular because they are accessible and easy to install, although some homes and apartments with unusually shaped windows may not accommodate them. Portable devices are a great choice because they can be moved from room to room, but they also require more maintenance and are not as effective. Built-in or separated systems offer a more permanent solution, but require professional installation and can be costly. How to clean the window air conditioning? Check the filter of your air conditioner window every month, and clean it as needed. Also, take a look at the pot of water inside the device, and wipe it with a rag or sponge - it will help to ensure proper drainage of condensation created by the device. It also helps prevent mold growth. How to install a window air conditioner? If you have basic DIY skills and some tools you will most likely be able to install air conditioning windows yourself though, because some units are very heavy and bulky, you can enlist a friend to help you. For those who are unsure of installing the air conditioning themselves, you can ask the seller when you are buying a new one, or try a service like HomeAdvisor. How much does the air conditioning cost? The cost of air conditioning varies depending on the type and functionality - you can spend from \$100 to several thousand dollars. Window models start at about \$100, but can cost upwards of \$1,000 if you need one with advanced features and high capacity BTU. Portable air conditioners tend to be a little more expensive, usually costing between \$200 and \$500. Wall air conditioners usually cost \$400 or more, and mini-split options start at about \$800 plus installation costs. Central air systems are often desirable because they can be used for heating as well, but you will probably pay a few thousand dollars for the system and installation. What are BTU and why are they important? The amount of heat that air conditioning can remove from the premises is measured in BTU, or British thermal units - larger rooms require units with higher BTU. Energy Star Units of about 6,000 BTU for rooms up to 250 square feet; 8,000 units of BTU with an area of up to 350 square feet; 10,000 units of BTU up to Square feet; and 12,000 BTU units up to 550 square feet. The Ultimate Air Conditioning Buying Guide If you live in a place where the weather is getting unbearably warm, chances are you rely on air conditioning to keep your home cool and comfortable-the Department of Energy states that 75 percent of American homes have some type of air conditioning. Although there are several common styles of air conditioning, they all work basically in the same way: first, they pull in hot air and filter out any dust, dirt, or other impurities. This air is then transmitted through a cooling or evaporating coil, and the coil absorbs heat. At the same time moisture from the air is reduced to dew on the surface of the coil, effectively reducing the level of humidity in the room. Cold air is then pushed out of the device, which helps to lower the overall temperature in the room. There are many factors to consider when buying an air conditioner. First, you will need to choose which style works for your home and needs, whether it's a window block, a portable model, or another option. You will also need to consider cooling, as well as the size of the room and the budget; Depending on what you choose, you can spend between \$100 and several thousand dollars on a cooling system. Read on for everyone you need to know the details of what to look for when you buy air conditioning. There are several important factors you want to think about to make sure you get the best air conditioning for your needs. Style One of the first things you want to consider is the air conditioning style that works best for you. There are several options, and they vary greatly in terms of costs, capabilities, and installation requirements. Two of the most common options for casual users are portable and window air conditioners. Both of these options are quite inexpensive and can be easily installed without professional help. However, the downside of these options is that they are usually only powerful enough to cool one room at a time, which means you will need multiple units if you want air conditioning throughout the house. Another option is a through wall or built-in air conditioning, which is a permanent style. These styles are fitted with a sleeve in the outer wall of your home-ideal if your room does not have an acceptable window. However, as you may have guessed, this air conditioning style requires a more complex initial installation, as you will need professional help to cut a hole of the appropriate size in the wall. Spruce For more comprehensive air conditioning, you can consider a ductless mini-split system. This style of air conditioning has gained popularity recently, as it is a good constant alternative for homes without central HVAC. As the name implies, there are no channels required, and these units are like more powerful than window units. However, mini-split systems are also quite expensive and complex to install. Finally, there are central air systems, systems, ducts all over the house. It is the most expensive and complex in installation and as such is usually the most common for new construction. Unit size If you go with a window or wall unit, measure the height and width of the hole to ensure you choose a compatible unit. It is also useful to consider the weight of the device, as it will determine whether you will need help moving and installing it. Room size and location Next, you want to consider where you plan to put the air conditioner and how many square meters it should cool down. The amount of heat that air conditioning can remove from the premises is measured in BTU, or British thermal units - larger rooms require units with higher BTU. Here is the overall breakdown of the recommended room size and BTU: 100-300 square feet: 5,000-7000 BTU per hour300-450 square feet: 8,000-10,000 BTU450-550 square feet: 10,000-12 BTU550-700 square feet: 13,000-14000 BTU700-1000 square feet: 18,000 BTU1,000 square feet: 20,000 BTU and up you also want to consider the location of the room as you choose that BTU is better. For example, a room that has several large windows and gets direct sunlight for hours a day is likely to be hotter and therefore need more powerful air conditioning. In this situation, experts recommend to increase the BTU by at least 10 percent. Similarly, if your air conditioning will be in the kitchen, and as a result, have to fight the heat from the oven, you will want to raise the power of about 4000 BTU. Energy efficiency One of the main problems of many people with air conditioning is that it uses a lot of electricity. The Department of Energy says 6 percent of all electricity in the country is used to power air conditioners, costing users a total of \$29 billion a year. With this in mind, you can take into account the energy efficiency when buying a new air conditioner. Start by looking at the EER, or energy efficiency rating, the higher the number, the more efficient the air conditioner. Every one per cent increase on the EER scale means a 10 percent increase in energy efficiency. For example, a unit with an EER rating of 12 is 20 percent more effective than a unit with a rating of 10. While units with high EER may initially be more expensive, they will likely save money in the long run on energy costs, especially if you regularly use air conditioning. Another way to choose a more efficient device is to find the Energy Star label. This certification is only available to products that are at least 10 percent more energy efficient than the federal government 40 per cent. Noise level If you plan to use air conditioning in your bedroom or living room, you may be concerned about how much noise it produces. The noise level of the appliances is usually measured in decibels, but since we do not use this measurement in our daily most people don't know what 40 decibels sound. This can make it tricky to choose the best option for you. In general, the standard air conditioner works from 40 to 60 decibels. For reference, TVs usually work at around 60 decibels, and normal conversation drops between 40 and 60 decibels. So if you buy an air conditioner that works at 60 decibels, it can interfere with your conversations or TV shows. The quietest air conditioners there operate at 35 to 40 decibels, and their noise level is compared to the table fan level. Added features Once you've decided on the basic style and specifications of your air conditioner, you may want to consider what additional features are available. For example, some devices use a remote control or programmable timers, making it easier to reach the perfect temperature. Other options have efficiency tools that will help you minimize your energy consumption. The best features to look for really depend on your personal priorities. Different types of air conditioners come with their advantages and disadvantages. Here are some important considerations to consider for each style. Window window air conditioners are a popular option in spaces you only need to cool for one season, as they can be installed and removed quite easily. Many people also love that these units don't take any space, however, you should make sure that there is a compatible electric output nearby, as many manufacturers recommend you don't plug your air conditioners into the extension cord. There are several considerations unique to window air conditioners. On the one hand, you need to determine in what style of window it will be installed in a standard, sliding or case, and find a compatible unit. In addition, you will have to decide whether you want to slip out or a fixed chassis (the frame that surrounds this unit). Models with a squirting chassis can also be installed as end-to-end blocks, and they are also a little easier to clean and maintain. Finally, you will need to purchase a compatible window bracket, as this will ensure your air conditioning remains safe in place and that there are no gaps around it. If you are comfortable, you can install a window block yourself, although it may be a good idea to enlist another person to help you as some units are very heavy. Spruce Window air conditioners start at \$100 for small, no-hills units, but they can cost upwards of \$1,000 if you need a model with advanced features and high BTU capacity. Portable portable air conditioners are even more versatile than window blocks, as they can be moved from room to room. This style is usually installed on wheels to facilitate transportation, although they take some space in the room where they work. Some portable air conditioners require a ventilation hose to route hot air out of your home, which usually requires a nearby or ventilation. If this seems inconvenient or not possible in your home, you will want to peek into the evaporating system that uses water (which you should put) to cool the air. This type of portable air Works best in places that have dry heat, as they tend to add moisture to the air. Portable air conditioners are often a little more expensive than window blocks, usually costing between \$200 and \$500. Through the wall through the wall or wall the air conditioning is very similar to the model windows, except that they are installed in the outside wall in your home. This type of air conditioning is a great option if you want a permanent fixture in a room that has no windows, or if you just want to keep your windows unencumbered! However, as you can probably imagine, they are more complex to install, usually requiring the help of a professional to make sure you don't accidentally hit the pipes or wires. One of the main considerations to make when choosing through the air conditioner wall is whether you want to use a traditional sleeve for a home device or if you prefer to get a model with a tossing chassis. Air conditioners with a spl fted chassis are sold as a single piece and can often be used as window blocks, so this can give you a bit of added versatility, although if you decide to use your as an air conditioner wall, you will have to buy a traditional sleeve separately. Wall air conditioners are on the more expensive side, usually costing \$400 or more, plus the installation price. The Mini-Split Mini-Split air conditioning systems are a little more complicated than other styles, as they consist of two main parts- an open compressor/capacitor and an indoor unit. Unlike central HVAC systems, mini-splits do not require ducts to work. Instead, they only need a small hole in the outer wall, where cords and condensation can come out. Many mini-split systems can provide both heating and cooling for your home, and they are a popular permanent option for older homes or those where installing ductwork is not possible. Their design without ducts also helps to improve energy efficiency, as a significant amount of energy is lost pushing the air through the ducts. Another key advantage is that each unit can be managed individually, so if you set a few around the house, you can set different rooms for different temperatures. As you may have guessed, mini split air conditioners are quite expensive, starting at about \$800 plus installation cost. However, it can be worth the investment if you live in a warm climate and need to cool your home a few months of the year. Central Air If you are building a new home or replacing the existing central air system, you may be in the market for a split system or central air conditioning. These models are the most expensive, as they are designed to cool the entire house, and they require duct systems throughout the house so they can spread cool air. Central air systems often because they can be used for heating as well, but you'll probably pay a few thousand dollars for the system, not to mention the cost of installation. Energy Star Certified If You You About the electricity your air conditioner will use, you can look for a model that is Energy Star certified. These units must meet the specific efficiency requirements regulated by the U.S. Department of Energy, and in general, they are at least 10 percent more efficient than government standards. While many may have higher initial costs, you will save money on energy in the long run. Wi-Fi Enabled If you're all about the convenience of smart appliances, you'll be glad to hear that there are many great Wi-Fi-enabled air conditioners available. These devices connect to the Internet and your smartphone, allowing you to control them remotely. In addition, many of them have features that help minimize energy consumption while maintaining a comfortable temperature. Some may also be able to integrate with other smart home devices such as the Amazon Echo or Nest Learning Thermostat. Today's smart air conditioners start at \$500. There are several reputable air conditioning brands that you are likely to come across as you shop. Frigidaire Dear Family Brand. Frigidaire offers a variety of air conditioners, including windows, portable and smart models. Like many of its appliances, Frigidaire air conditioners are affordable and highly appreciated by users. GE GE ge is another reliable brand of appliances, and they offer a large number of window and end-to-end air conditioners that can be found in most major retail stores. LG Spruce If you are partial to LG electronics, you will be happy to find this famous brand offers a wide range of air conditioners, including windows, through the wall, portable and smart models. Amana If you are looking for energy efficient air conditioning, be sure to check out Amana, which manufactures windows, through the wall, and central air conditioning systems. Many of the products of this brand have an EER rating of 12 or more. Friedrich While a smaller brand, Friedrich still offers a comprehensive line of air conditioners, including windows, walls, mini-splits, and portable models. Although these products are often on the expensive side, they are usually energy efficient and offer a variety of advanced features, including Wi-Fi connectivity. Mitsubishi Primarily known as the Japanese automaker, Mitsubishi also offers a highly regarded line of mini-split air conditioning systems, many of which have intelligent capabilities. Goodman If you're looking for a central air conditioning system to cool the whole house, you'll probably meet Goodman, who sells several popular models. These units are known for their durability, and some even offer lifetime guarantees. Most air conditioners come with a manufacturer's warranty, so you don't have to worry about buying one separately. These guarantees can cover one to 15 years, but 10 is pretty standard. As a rule, guarantees for air conditioners are limited, that is, they cover only issues related to production defects. You will need to Product after purchase and keep up with the recommended maintenance schedule to make sure your warranty remains in place, and if you ever need to repair the device, be sure to use parts approved by the manufacturer. Failure to do so may result in the cancellation of your future insurance coverage.
